# Introduction

## Objective

The Trend Indicator Return Series (“TIRS”) family is an expandable set of indices. The objective of each TIRS index is to capture the performance of a trend signal informed strategy that dynamically allocates between a digital asset (or multiple digital assets) and an alternate asset.

The digital asset (the “Primary Constituent”) may be represented by a digital asset price index, an investment product, or an index that reflects the performance of futures contracts on a digital asset. The alternate asset (the “Secondary Constituent”) may be reflected by a fiat currency, a stablecoin, a yield-bearing instrument, a yield-bearing investment product, or an index of any of these.

Each trend signal (the “Trend Indicator”) is provided by one of the Trend Indicator family of signals published by CoinDesk Indices (“CDI”), whose methodology can be found [here](#).

Variations of TIRS indices share the same calculation with passed parameters that give each index its identity.

Parameters for each current TIRS index are specified in Appendix 1. Additional variations may be added through an update to this methodology.

## Highlights

The TIRS family was created by CDI and launched in October 2023. The Trend Indicator family, whose values are used as allocation signals in each TIRS variation, was created by CoinDesk Indices (“CDI”) and launched in March 2023.

This methodology was created by CDI to achieve the above-stated Objective. There may be circumstances or market events that require CDI, in its sole discretion, to deviate from or amend these rules to ensure each TIRS variation continues to meet the Objective. This document should be read in conjunction with the applicable methodology of the underlying component indices and Trend Indicator signals.

## Input data

For each TIRS index, the pricing of the underlying constituents and current and historical Trend Indicator values, as specified in Appendix 1, are the sole input data for calculation.

# Calculation

## Index calculation

Each TIRS Index is calculated at the Calculation Frequency specified in that TIRS Index's parameters as indicated in Appendix 1.

## Constituent weighting

The weights of the Primary and Secondary Constituents are set at each rebalancing event. As defined in Appendix 1, the weight of the Primary Constituent is set to the specified allocation based on the appropriate Trend Indicator value subject to a Max Indicator Change<sup>1</sup> as defined in Appendix 1. The weight of the Secondary Constituent is calculated as:

Weight of Secondary Constituent = 1 - Primary Constituent weight

In the event the underlying Trend Indicator value for the current rebalance is the same as the trend indicator used to determine weights for the prior rebalancing event (including any adjustments made due to Max Indicator Change), the rebalancing event will not be implemented, and calculation will continue to use the data from the last implemented rebalance.

## Calculation formula

For each TIRS index whose parameters are indicated in Appendix 1,

$$Index_t = Index_{RB} \times \left( 1 + w_{PC,RB} \times \left( \frac{PC_t}{PC_{RB}} - 1 \right) + (1 - w_{PC,RB}) \times \left( \frac{SC_t}{SC_{RB}} - 1 \right) \right)$$

where,

$Index_t$  = TIRS index value at time  $t$ ,

$Index_{RB}$  = TIRS index value as of the most recent rebalance,

$PC_t$  = value of the Primary Constituent at time  $t$ , rounded to 2 decimals,

$PC_{RB}$  = value of the Primary Constituent as of the most recent rebalance, rounded to 2 decimals,

$w_{PC,RB}$  = the Primary Constituent Allocation as of the most recent rebalance,

---

<sup>1</sup> For certain TIRS, as defined in Appendix 1, a Max Indicator Change is enforced at each rebalancing event to reduce turnover. The Max Indicator Change defines the maximum number of level changes an indicator can move since the prior rebalance. (For example, if the trend signal value determined at the prior rebalance is -0.5 and the Max Indicator Change is set to 2 then the possible values at the next rebalance are limited to -1.0, -0.5, 0.0 or 0.5. In the event the new Trend Indicator Value is 1.0 it will be adjusted to 0.5 to determine constituent weights.)

$SC_t$  = value of the Secondary Constituent at time  $t^2$ , rounded to 2 decimals,  
 $SC_{RB}$  = value of the Secondary Constituent as of the most recent rebalance,  
rounded to 2 decimals.

## Index Maintenance

### Index Rebalancing

Each TIRS Index is rebalanced based on the schedule and parameters specified in Appendix 1. Rebalancing events will only be implemented if the applicable Trend Indicator Value for the current rebalance is different than that Trend Indicator Value determined on the prior rebalance. In the event the Trend Indicator Value is equal to that of the prior rebalance, the rebalancing event will be skipped.

Rebalances take place on the Rebalancing Day at the Rebalancing Time, at which time the Primary Constituent Allocation is set to equal the value corresponding to the Trend Indicator Value determined on that Rebalancing Day subject to any lag as detailed by the Trend Indicator Lag Days in Appendix 1. Rebalances are only implemented on calculation days and may be adjusted, or skipped, due to holidays as detailed in Appendix 1.

### Constituent Replacement

In the event a Primary or Secondary Constituent of a TIRS index is discontinued or no longer appropriate, the Index Committee will determine and announce a replacement. In the event a suitable replacement is not available, the Index Committee reserves the right to discontinue the impacted TIRS index.

### Trend Indicator Disruption

In the event there is a delay publishing the Trend Indicator Value required to rebalance a TIRS index, the scheduled index rebalancing event may be postponed or skipped. This will be determined by the Index Committee and announced to subscribers.

## Data distribution

Each TIRS index will be available through a CoinDesk Indices API. Calculation days and times for each TIRS Index are as indicated in Appendix 1. Please contact [sales@coindesk-indices.com](mailto:sales@coindesk-indices.com) for details.

---

<sup>2</sup> If the Secondary Constituent is "CASHIDX",  $SC_t$  and  $SC_{RB}$  are both equal to 1,000.00.

# Index Governance

The CoinDesk Index Committee provides ongoing oversight of each Index and its Methodology. For more details on the Index Committee, please refer to the Index Governance section of the CoinDesk Digital Asset Indices Policy Methodology.

# Appendix 1: TIRS Indices

The table below provides parameters for each TIRS index.

CoinDesk Bitcoin Trend Indicator Futures Index (Symbol: BTIUSF)		
Trend Indicator	BTI	
Calculation Frequency	Daily	
Primary Constituent	CoinDesk Bitcoin Futures Excess Return Index (Ticker: BFIC) <sup>3</sup>	
Secondary Constituent	Global X 1-3 Month T-Bill ETF (NYSE Ticker: CLIP) <sup>4</sup>	
Rebalance Day(s)	Wednesday (prior calculation day if Wednesday is a holiday)	
Rebalance Time	4:00pm Eastern time	
Trend Indicator Lag Days	1 calendar day	
Max Indicator Change	2	
Allocations	Trend Indicator Value	Primary Constituent Allocation
	1	100%
	0.5	75%
	0	50%
	-0.5	25%
	-1	0%
Calculation Days	Follows CME trading calendar found <a href="#">here</a>	
Calculation Time	Daily using 4:00pm closing prices	
Calculation Frequency	End of Day	
Launch Date	2/7/2024	
Base Date	12/27/2017	
Base Value	1000.00	

<sup>3</sup> For more details on BFIC please refer to the CoinDesk Bitcoin Futures Index [Methodology](#).

<sup>4</sup> CLIP dividends will be reinvested back into CLIP at the close of the ex-dividend date. A CLIP return series will be derived based on the CLIP ETF price and CLIP dividends to accurately reflect the performance of reinvested dividends and serve as the input for the Secondary Constituent (SC) prices in the calculation formula.
